Part of subsystem are not finished

Subsystem that is not implemented is also almost done, so time for integration is main reason.

70% completed

Risk

During Project

1 **Risk for server**

Unavailable of physical server

2 **Schedule delayed**

Difficulty of creating documents
Lack of experience

차봉건

The special thing in this project is that there are documents. requirements / design is specified by them. By doing this project I could think about developing large-scale system and realize importance of documents.

강재현

It was a good experience for working on a software project and learn how to proceed the project, how to manage the risks, how to be ready before the implementation. Although the project face many problems and not enough time to manage whole process of software engineering, it was good opportunity to learn how the software is developed.

유재현

At first, I thought development is more important than documentation.
However, as I take lessons and write documents, I realized that well-written documents can determine development time of project.
It is good time to learn the importance of the documentation.

김태규

This was the first time, I had planned a project from the beginning. Even though our schedule planning and writing many kinds of documents skill was not good, I can realized how much this can help the project. I think this experience will be of great help in my future large scale projects.

성아영

At first, I didn't feel the need to write a document, but I felt how important it was to document a prior plan when I saw that I continued to refer to it during the development process, even though it wasn't a perfect one. And I was worried that I am the only double major, so I was thankful that the team members helped me a lot

“Thank you
For listening”
